ABOUT THE AMERICAN LIVER FOUNDATION

History
The American Liver Foundation was created in 1976 by the American Association for the Study of Liver Disease. This organization of scientists and healthcare professionals was concerned with the rising incidence of liver disease and the lack of awareness among both the general public and the medical community.

Mission
The American Liver Foundation (ALF) is the nation’s leading non-profit organization for promoting liver health and disease prevention. ALF provides research, education and advocacy for those affected by liver-related diseases, including hepatitis.

Vision
We envision a day when liver disease is seldom found, easily cured, and when liver transplants are a thing of the past.

Organization
The ALF is a national organization fighting liver disease with twenty six chapters across the country, each supported by their local communities and offering important programs and services tailored to the needs of each community. We support patients, fund medical research, educate medical professionals and inform the public about the importance of liver health.

The National Capital Area Chapter
The National Capital Area Chapter serves the greater DC area, including all of Maryland and Virginia. We seek to EDUCATE our community about liver wellness, risk factors, disease prevention, symptom identification and treatment. We work to ADVOCATE for programs and policies that serve those affected by liver disease at both the local and national levels. We raise funds for RESEARCH, so that we can improve outcomes for those affected by liver disease and prevent future infections.

You can reach us Monday-Friday at our local office:

National Capital Chapter of the American Liver Foundation
127 South Peyton Street, Suite #220
Alexandria, VA 22314
Phone: 703-535-8880
Fax 703-535-8890

YOUR LIVER AND LIVER HEALTH

What your liver does
Your liver has many functions. The most important are that it:
- Converts food into nutrients
- Detoxifies substances that are harmful to the body
- Processes everything we eat, breathe and absorb through our skin
- Stores vitamins, minerals and sugars

Caring for your liver
There are Action Steps you can take to keep your liver healthy. Remember your ABCs and contact us for more information about activities that can put you at risk for specific liver diseases.

“A” — Avoid Hepatitis and Liver Disease
Certain behaviors put you at risk for getting infected with a potentially serious liver disease. There are many causes of liver disease, including: heredity, reaction to drugs and chemicals and viruses.

“B” — Be Careful of What Gets Into Your Body
Everything that you eat, drink, and breathe gets filtered by your liver. Even paint or chemicals absorbed through your skin gets filtered by your liver.

“C” — Consult Your Doctor
Your doctor should be your partner in liver health. Ask your doctor about your liver enzymes, if you have any risk factors for liver disease, and about the vaccine for hepatitis A and B. If you do have a liver disease, there are specialists that you can be referred to and there are treatments available.
LIVER DISEASE

Symptoms of liver disease
Although many people with liver diseases or disorders often have no symptoms, some warning signs can include:

- Yellow discoloration of the skin or eyes
- Abdominal swelling or severe abdominal pain
- Prolonged itching of the skin
- Very dark urine or pale stools; or the passage of bloody or tar-like stools
- Chronic fatigue, nausea or loss of appetite

Medical terms to know

Ablation  Some liver tumors can be destroyed by processes called ablation. Radio frequency ablation kills liver tumors by heating them to high temperatures with microwave probes. Another ablation technique destroys tumors by injecting them with ethanol, a form of alcohol.

Ascites  Fluid in the abdomen.

Bacteremia  The presence of bacteria in the bloodstream.

Chemotherapy  Although chemotherapy cannot cure liver cancer, a new technique called transarterial chemoembolization may help prolong life for liver cancer patients. In this procedure, chemotherapy drugs are injected into the blood vessels that feed the tumors. This delivers a high dose of chemotherapy to the tumor while decreasing the flow of blood that feeds the tumor.

Cholangitis  Inflammation of the bile ducts.

Cholestasis  This is a condition where bile cannot correctly flow from your liver into your small intestine.

Cirrhosis  Cirrhosis of the liver is scarring and hardening of the liver. The scar tissue blocks blood flow to the liver and prevents it from working properly.

Cryosurgery (cryotherapy)  This is the use of extreme cold produced by liquid nitrogen (or argon gas) to destroy abnormal tissue.

CT Scan and MRIs  These are more comprehensive methods of imaging your liver.

Fibrosis  If left untreated, the inflamed liver will start to scar. As excess scar tissue grows, it replaces healthy liver tissue. This process is called fibrosis.

Hepatitis  Inflammation of the liver. Hepatitis can be caused by a virus, alcohol/drug abuse, or metabolic causes.

Jaundice  A yellowing of body tissues, including the skin and the white of the eyes. It is caused by increased formation of bilirubin or by problems excreting excess bilirubin from the body.

Liver biopsy  Liver biopsy is a medical procedure in which a doctor where a small sample of liver tissue is removed with a needle and then examined to determine the extent of liver damage.
Liver function tests  Usually when people talk about liver enzymes, they mean AST (alanine aminotransferase) and ALT (aspartate aminotransferase). A Liver Panel can also include other tests like bilirubin and alkaline phosphatase. Normal AST and ALT levels can vary, so it is important to discuss your individual results with your doctor. You can also find some helpful information about understanding lab results at the US Department of Veteran’s Affairs website: http://www.hepatitis.va.gov/vahep?page=diag-tests-00

Radiation therapy  In some cases of liver cancer, doctors may try to reduce the size or slow the growth of liver cancer with radiation, or high-energy x-rays. Traditional radiation therapy also destroys healthy liver tissue, so doctors are experimenting with new techniques that deliver the radiation with higher precision.

Sepsis  A severe illness caused by overwhelming infection of the bloodstream by toxin-producing bacteria. Symptoms may include fever, chills, malaise (generally feeling "rotten"), low blood pressure, and mental status changes. Sepsis can be life-threatening, requiring urgent care. Treatment depends on the type of infection, but usually begins with antibiotics or similar medications. Also known as blood poisoning, septicemia.

Sonogram  This is a cheap and fast method used to detect masses on the liver. It’s not always definitive, so you may need more tests.

Surgical Resection  In cases where liver cancer has been found early and the liver is otherwise healthy, or has only early-stage cirrhosis, doctors will remove the portion of the liver where the tumor is located, a process called surgical resection.

Overview of some of the more common liver diseases

Alagille Syndrome  Alagille syndrome is an inherited disorder that closely resembles other forms of liver disease seen in infants and young children. However, a group of unusual features affecting other organs distinguishes Alagille syndrome from the other liver and biliary diseases of infants. Children with Alagille syndrome usually suffer a progressive loss of the bile ducts within the liver over the first year of life and narrowing of bile ducts outside the liver. This leads to a buildup of bile in the liver, causing damage to liver cells. Scarring may occur and lead to cirrhosis in about 30 to 50 percent of affected children.

Alcohol Induced Liver Disease  There are three kinds of liver disease related to alcohol consumption:

  * **Fatty liver** is a type of alcohol-induced liver disease. It is marked by a build-up of fat cells in the liver. Usually there are no symptoms, although the liver may be enlarged and you may experience discomfort in your upper abdomen. Fatty liver occurs in almost all people who drink heavily. The condition will improve after you stop drinking.
  * **Alcoholic hepatitis** is an inflammation of the liver. Up to 35 percent of heavy drinkers develop alcoholic hepatitis. In its mild form, alcoholic hepatitis can last for years and will cause progressive liver damage. The damage may be reversible if you stop drinking. In its severe form, the disease may occur suddenly, after binge drinking, and it can quickly lead to life threatening complications.
  * **Alcoholic cirrhosis** is the most serious type of alcohol-induced liver disease. Cirrhosis refers to the replacement of normal liver tissue with scar tissue. Between 10 and 20 percent of heavy drinkers develop cirrhosis, usually after 10 or more years of drinking. The damage from cirrhosis
is not reversible, and it is a life-threatening disease. Your condition may stabilize if you stop drinking.

**Autoimmune Hepatitis**  Autoimmune hepatitis is a potentially life-threatening disease in which the body’s own immune system attacks the liver and causes it to become inflamed. The disease is chronic and 70% of those affected are women, usually between 15-40 years old. If untreated, it can lead to cirrhosis and liver failure. In most cases, autoimmune hepatitis can be controlled with medication but not cured.

**Biliary Atresia**  Biliary atresia is a disease of the bile ducts that affects only infants. In biliary atresia, the bile ducts become inflamed and blocked soon after birth. This causes bile to remain in the liver, where it starts to destroy liver cells rapidly and cause cirrhosis, or scarring of the liver. The cause of this disease is not known and there is no cure for biliary atresia. The only treatment is a surgical procedure in which the blocked bile ducts outside the liver are replaced with a length of the baby’s own intestine, which acts as a new duct. This surgery is called the Kasai procedure. If the Kasai procedure is not successful, the only other option is a liver transplant.

**Fatty Liver Disease**  Fatty liver is just what its name suggests: the build-up of excess fat in the liver cells. If fat accounts for more than 10% of your liver’s weight, then you have fatty liver and you may develop more serious complications. Fatty liver may cause no damage, but sometimes the excess fat leads to inflammation of the liver. This condition, called steatohepatitis, does cause liver damage. Sometimes, inflammation from a fatty liver is linked to alcohol abuse; this is known as alcoholic steatohepatitis. Otherwise the condition is called nonalcoholic steatohepatitis, or NASH. An inflamed liver may become scarred and hardened over time. This condition, called cirrhosis, is serious and often leads to liver failure. NASH is one of the top three leading causes of cirrhosis.

**Hemochromatosis**  Hemochromatosis is one of the most common genetic disorders in the United States. It is an inherited condition in which the body absorbs and stores too much iron. The extra iron builds up in several organs, especially the liver, and can cause serious damage. Without treatment, the disease can cause these organs to fail. Treatment for hemochromatosis involves ridding the body of excess iron through periodic phlebotomy (removal of blood).

**Hepatitis A**  Hepatitis A is a viral infection of the liver caused by the hepatitis A virus, or HAV. It is not a long lasting or chronic infection, and nearly all people recover from hepatitis A within six months without any lasting health problems. Most cases of hepatitis A are caused by consuming food or water contaminated with fecal matter that contains the virus. Hepatitis A is vaccine preventable.

**Hepatitis B**  Hepatitis B is a disease of the liver that is caused by the hepatitis B virus, or HBV. Most hepatitis B infections are short-term, or acute, and do not cause lasting health problems, but in 5% of adult cases hepatitis B becomes a long-term (chronic) condition. Chronic hepatitis B can lead to more serious liver diseases, including cirrhosis, liver failure and liver cancer. Hepatitis B is vaccine preventable.

**Hepatitis C**  Hepatitis C is a disease of the liver that is caused by the hepatitis C virus, or HCV. Between 60 and 85 percent of patients cannot get rid of the virus in its acute stage and develop a long-term, or chronic, hepatitis C infection. Chronic hepatitis C is a serious condition that damages the liver and can lead to potentially fatal liver diseases such as cirrhosis, liver failure
and liver cancer. One of the most common reasons for liver transplants is damage caused by hepatitis C infection. There is no vaccine to prevent hepatitis C, but many people can be treated successfully with antiviral medications.

**Liver Cancer**  Liver cancer refers to the growth of malignant tumors in liver tissue. Cancer that starts in the liver is called primary liver cancer. Cancer that spreads to the liver from another organ is called metastatic liver cancer. Often there are no symptoms of liver cancer until the later stages. This is why early detection is difficult. Liver cancer is treated in a variety of ways, such as cryosurgery, surgical resection, ablation and chemotherapy. For some patients, transplant may be an option.

**Primary Biliary Cirrhosis**  Primary biliary cirrhosis, or PBC, is a chronic, or long-term, disease of the liver that slowly destroys the medium-sized bile ducts within the liver by inflammation. This causes bile to remain in the liver, where gradual injury damages liver cells and causes cirrhosis, or scarring of the liver. As cirrhosis progresses and the amount of scar tissue in the liver increases, the liver loses its ability to function.

**Primary Schlerosing Cholangitis**  Primary sclerosing cholangitis (PSC) is a chronic, or long-term, disease that slowly damages the bile ducts inside and outside the liver. This causes bile to accumulate in the liver, where it gradually damages liver cells and causes cirrhosis, or scarring of the liver. As cirrhosis progresses and the amount of scar tissue in the liver increases, the liver slowly loses its ability to function. Many people with PSC will ultimately need a liver transplant, typically about 10 years after being diagnosed with the disease. PSC may also lead to bile duct cancer.

**Reye Syndrome**  Reye syndrome is a rare illness that affects all bodily organs but is most harmful to the brain and the liver. It occurs primarily among children who are recovering from a viral infection, such as chicken pox or the flu. It usually develops a week after the onset of the viral illness but can also occur a few days after onset. Liver-related complications of Reye syndrome include fatty deposits, abnormal liver function tests, and poor blood clotting and bleeding caused by liver failure. Reye syndrome is often misdiagnosed as encephalitis, meningitis, diabetes, drug overdose, poisoning, sudden infant death syndrome, or psychiatric illness. There is no cure for Reye syndrome. Successful management, which relies on early diagnosis, is aimed primarily at protecting the brain from irreversible damage by reducing brain swelling, preventing complications in the lungs, and anticipating cardiac arrest.

**Wilson’s Disease**  Wilson's disease is an inherited condition that causes the body to retain excess copper. The liver of a person who has Wilson's disease does not release copper into bile as it should. As the copper builds up in the liver, it begins to damage the organ. If not treated, Wilson's disease can cause severe brain damage, liver failure, and death. If detected early and treated properly, a person with Wilson's disease can enjoy completely normal health.
TREATMENT FOR LIVER DISEASE

How to choose a doctor

Hepatitis and other liver disease treatments are most often provided by Hepatologists (liver specialist) and gastroenterologists. Internist and Primary care physicians also sometimes provide treatment in consultation with a liver disease specialist.

The following hospitals in our area have hepatologists on staff:

**Inova Fairfax Center for Liver Disease**
http://www.inova.org/liver/index.jsp  
703-208-6650

**Georgetown Transplant Center and International Center for Liver Diseases**
http://www.georgetownuniversityhospital.org/body.cfm?id=115  
202-444-2000

Comprehensive Liver Center at the University of Maryland Medical Center  
http://www.umm.edu/transplant/liver/index.htm  
1-800-492-5538

**The Johns Hopkins Gastroenterology & Hepatology Resource Center**
www.hopkins-gi.org  
410-955-4166

**University of Virginia Digestive Health Center of Excellence**
434-924-2959

**Medical College of Virginia- Virginia Commonwealth University Health Systems**
Division of Gastroenterology, Hepatology and Nutrition  
http://www.intmed.vcu.edu/home/divisions/gastroenterology.html  
804-828-4060

To find a hepatologist in your area, go to www.aasld.org. The American Association for the Study of Liver Disease (AASLD) provides a patient directory to all hepatologists.

Important questions to ask at your doctor’s appointment

For those diagnosed with hepatitis:
- Do I have an acute or chronic infection?
- Do I have high or low virus level?
- Do I have mild or severe liver damage? Will I need a liver biopsy to determine the extent of liver damage?
- What are my chances of developing cirrhosis or liver cancer?
- Do I need to have my family tested?
- What treatment is available for my disease? Should I receive treatment? How will treatment help me? What do I need to know about my treatment?
- What are my chances of clearing the virus if I receive treatment?
- What is the chance of me developing cirrhosis or liver cancer if I do not receive treatment?
• How long will I need to be treated? When can I expect to see the results from the treatment? How will you assess whether the treatment is working for me?
• What are the potential side effects of treatment? What should I do if I have side effects? Is there anything I can take to help the side effects go away?
• If I do not need to receive treatment now, how often should I be tested?
• What medicines or other substances should I avoid to protect my liver? Do I have to stop drinking alcohol even if I only have a few beers or a glass of wine once a week?
• What type of diet will help me protect my liver? Should I lose weight? How can I do so safely?
• Should I take any special precautions to avoid infecting others?

For those diagnosed with any liver disease:
• Do I have mild or severe liver damage? Will I need a liver biopsy to determine the extent of liver damage?
• What treatment is available for my disease? Should I receive treatment? How will treatment help me? What do I need to know about my treatment?
• How long will I need to be treated? When can I expect to see the results from the treatment? How will you assess whether the treatment is working for me?
• What are the potential side effects of treatment? What should I do if I have side effects? Is there anything I can take to help the side effects go away?
• What medicines or other substances should I avoid in order to protect my liver? Do I have to stop drinking alcohol even if I only have a few beers or a glass of wine once a week?
• What type of diet will help me protect my liver? Should I lose weight? How can I do so safely?
• Do I need to have my family tested?

**Hepatitis testing**

Viral hepatitis is the most common form of liver disease. If you find out that you have hepatitis B or C you will need additional tests to find out if you have any liver damage and if you are eligible for treatment. Some people have very little or no liver damage, others have some damage (called fibrosis) and some people have much more severe liver damage (called cirrhosis).

For information about local testing sites, see the “**Local Health Services**” section of this guide, which includes resources for DC, Maryland, and Virginia.

**Hepatitis A and B Vaccinations**

There are vaccinations available to prevent transmission of hepatitis A and hepatitis B. All children attending public school in our area must receive a hepatitis B vaccination. (You can receive your hepatitis A vaccination in conjunction with your hepatitis B vaccination series.) For information about local vaccination sites, see the “**Local Health Services**” section of this guide, which includes resources for DC, Maryland, and Virginia.

Vaccination is the best way to prevent hepatitis B because it gives you long term immunity. The hepatitis B vaccine is given in three doses. The first two doses are given a month apart; the final dose is given about six months later.

The ALF recommends **hepatitis B** vaccination for:
• All newborns, infants, children and teenagers
• Health care and emergency workers
• Hemodialysis patients
• Patients with chronic liver disease
• Military personnel
• Morticians and embalmers
• Patients and staff at institutions for the developmentally challenged
• Prison inmates
• People with multiple sexual partners
• Men who have sex with men
• Injection drug users
• Sexual partners and household members of people with hepatitis B
• International travelers who expect to have close contact with residents in countries or regions where there is a high rate of hepatitis B infection
• Members of ethnic or racial groups with a high rate of hepatitis B infection (including Asian Americans, African Americans, Latino Americans, Native Americans and Alaskan Natives)

Vaccination is the best way to prevent hepatitis A because it gives you long-term immunity. The hepatitis A vaccine is given in two doses, usually about six months apart.

The ALF recommends hepatitis A vaccination for:
• All children age one or older
• Travelers to regions with poor sanitation or where hepatitis A is common, such as the Middle East, South America, Eastern Europe, Central America, Africa, Southeast Asia, Mexico and the Caribbean
• Patients with long-term liver disease or blood-clotting disorders such as hemophilia
• People who have had, or are waiting for, a liver transplant
• People who use illegal drugs
• Men who have sex with men

Transplants
A liver transplant is surgery to replace a diseased liver with a healthy liver. When a patient receives a liver transplant, his or her entire liver is removed. It is then replaced by either a complete new liver or a portion of a healthy liver. (Once transplanted, a piece of a healthy liver can grow into a normal-size liver.)

In most cases, the new liver or liver tissue comes from a deceased donor. It is becoming more common, however, for patients to receive liver tissue from a living donor, who may be a family member. In this case, the transplant surgeon removes part of the donor's liver and uses it to replace the patient's liver.

Liver transplantation is needed for patients who are likely to die because of liver failure. Many diseases can cause liver failure. The most common is cirrhosis, which is the scarring and death of liver cells. Cirrhosis caused by hepatitis C is the most common reason for liver transplants.

Other conditions that may ultimately require a liver transplant include:
• Diseases of the bile ducts, including biliary atresia, primary biliary cirrhosis (PBC) and primary sclerosing cholangitis (PSC), which can cause liver failure if there is a backup of bile in the liver.
• Some inherited diseases, such as Wilson disease, in which dangerous levels of copper build up in the body, and hemochromatosis, where the liver is overwhelmed by iron.
• Primary liver cancer or cancer that affects only the liver.
• Alcoholism which can cause cirrhosis.

Who is eligible for a liver transplant?
There are many more people who need a liver transplant than there are livers available for donation. Patients are examined by a team of specialists to determine if a liver transplant is appropriate and likely to succeed. If so, they are placed on a national transplant waiting list. This waiting list is prioritized so the sickest people always go to the top of the list. About 17,000 Americans are currently on a waiting list for a liver transplant.

What is the average amount of time that patients wait for a donated liver?
The time that people spend waiting for a liver transplant varies widely. Blood type, body size, severity of illness and availability of donor organs all affect waiting time. Some people who develop sudden and complete liver failure from an acute illness may only have to wait a few days for a transplant. Other people, whose condition is less severe, may stay on the waiting list for many months.

What happens during transplant surgery?
Liver transplant surgery takes between six and 12 hours. During the operation, doctors remove the diseased liver and replace it with the donated liver. Most patients stay in the hospital for up to three weeks after surgery.

What are the side effects of a liver transplant?
The most common side effects are caused by the drugs that treat or prevent rejection. These side effects can include fluid retention, raised blood pressure, headaches, diarrhea and nausea. The severity of these side effects varies among patients.

What lifestyle changes are associated with liver transplants?
Most patients can return to a normal or near-normal lifestyle six months to a year after a successful liver transplant. When practical, transplant recipients should avoid exposure to people with infections. Maintaining a balanced diet, getting regular exercise and staying on prescribed medications are all important ways to stay healthy.

What is the outlook for liver transplant patients?
The outlook for patients is often expressed as a five-year survival rate. This refers to the percentage of liver transplant patients who are still alive five years after their transplant. The five-year survival rate for liver transplant patients is about 75 percent. Patients who receive livers from living donors have a slightly higher survival rate than patients whose livers came from deceased donors.

Transplant Resources

**Carolina Donor Services**  [www.carolinadonorservices.org](http://www.carolinadonorservices.org)  (252) 757 - 0090

Serves:
• Virginia Counties: Pittsylvania and Danville

Serves:
• Virginia counties: Accomack, Albemarle, Alleghany, Amelia, Amherst, Appomattox, Augusta, Bath, Bedford, Bland, Botetourt, Brunswick, Buckingham, Campbell, Caroline, Carroll, Charles
City, Charlotte, Chesterfield, Craig, Cumberland, Dinwiddie, Essex, Floyd, Fluvanna, Franklin, Frederick, Giles, Gloucester, Goochland, Grayson, Greene, Greensville, Halifax, Hanover, Henrico, Henry, Highland, Isle of Wight, James City, King and Queen, King William, Lancaster, Louisa, Lunenburg, Madison, Mathews, Mecklenburg, Middlesex, Montgomery, Nelson, New Kent, Northampton, Northumberland, Nottoway, Orange, Page, Patrick, Powhatan, Prince Edward, Prince George, Pulaski, Rappahannock, Richmond, Roanoke, Rockbridge, Rockingham, Shenandoah, Southampton, Surry, Sussex, Tazewell, Westmoreland, Wythe, and York

- Virginia Cities: Bedford, Buena Vista, Charlottesville, Chesapeake, Clifton Forge, Colonial Heights, Covington, Emporia, Franklin, Galax, Hampton, Harrisonburg, Hopewell, Lexington, Lynchburg, Martinsville, Newport News, Norfolk, Petersburg, Poquoson, Portsmouth, Radford, Richmond, Roanoke, Salem, Staunton, Suffolk, Virginia Beach, Waynesboro, Williamsburg and Winchester

Living Legacy Foundation of Maryland  www.thelf.org  (410) 242 - 7000
Serves:
- Maryland Counties: Allegany, Anne Arundel, Baltimore, Caroline, Carroll, Dorchester, Garrett, Harford, Howard, Kent, Queen Anne's, St. Mary's, Somerset, Talbot, Washington, Wicomico, Worcester
- Maryland Cities: Baltimore

Transplant Centers in Living Legacy Foundation’s Service Area: Johns Hopkins University Hospital

Tennessee Donor Services  http://www.donatelifetn.org/  (615) 234 – 5251
Serves:
- Virginia Counties: Buchanan, Dickenson, Lee, Russell, Scott, Smyth, Washington, and Wise
- Virginia Cities: Bristol and Norton

United Network for Organ Sharing  www.unos.org
Dedicated to the patients waiting and the donor families who have shared the gift of life.

Washington Regional Transplant Community  www.wrtc.org  (703) 641 – 0100
Serves:
- Washington, DC
- Maryland Counties: Calvert, Charles, Frederick, Montgomery, and Prince George's Counties
- Virginia Counties: Arlington, Clarke, Culpeper, Fairfax, Fauquier, King George, Loudoun, Prince William, Spotsylvania, Stafford, and Warren
- Virginia Cities: Alexandria, Fairfax, Falls Church, Fredericksburg, Manassas and Manassas Park
- West Virginia Counties: Berkeley and Jefferson Counties

Transplant Centers in Washington Regional Transplant Community’s Service Area: Georgetown University Medical Center, University of Maryland Medical Center
TREATMENT/PRESCRIPTION ASSISTANCE AND OTHER RESOURCES

Hepatitis Treatment Assistance for the Uninsured
The cost of hepatitis B and C treatment can be expensive. If you are insured, some health insurance companies do cover the cost of the recommended treatments. If you are uninsured or underinsured there are programs available to help with the cost of hepatitis antiviral drug treatment.

The Frederick County Hepatitis Clinic, Inc. In this area, we are fortunate to have one dedicated hepatitis clinic. The clinic offers hepatitis testing and treatment for qualifying individuals. Patients are asked to make a $20 co-pay per visit. You do not need to be a resident of Maryland.
350 Montevue Lane
Frederick, MD 21702
301-631-3343

Partnership for Prescription Assistance A network with 475 prescription plans in the United States. These programs offer discounted (and sometimes free) medications to qualified, enrolled participants.
1-888-4-PPA NOW
https://www.pparx.org/Intro.php

Together Rx Access Provides a 25% to 40% discount on the price of medication offered by the plan.

Clinical Trials Clinical trials can be a way to access prescription medicines if you cannot afford them.
www.clinicaltrials.gov – Provides lists by city and state for every clinical trial in the country.
www.centerwatch.com – A clinical trial listing service of industry- and government-sponsored trials, including recently FDA-approved drug therapies.
Miscellaneous Prescription Assistance

The Pharmaceutical Research and Manufacturers of America  This organization includes 48 drug companies that have assistance programs offering medications for free - or for reduced prices - to people who cannot afford to pay full price. Each company has different rules about who gets help, but the programs really work.
1-800-762-4636 for free directory
http://www.helpingpatients.org

U.S. Department of Veterans Affairs  Eligible veterans can get prescriptions filled for just $7 per month per drug through the VA. Purple Heart awardees, former POWs, and disabled vets receive highest priority. Other new enrollees must meet a means test that varies according to the veteran's state and county of residence. The veteran must be seen by a VA doctor.
1-877-222-VETS
http://www1.va.gov/health_benefits

Help for Uninsured Children  Families who need help paying for their children's prescriptions should look into their state's Children's Health Insurance Program. Children who don’t have other health insurance and whose families' incomes are less than 300 percent of the federal poverty level may be eligible.
1-877-KIDS-NOW
http://www.insurekidsnow.gov

Indigent Prescription Programs  This site contains a list of names and telephone numbers of prescription drug companies that have indigent programs in place.

Other Resources for Patients and Families

Out-of-Pocket Cost Assistance

The HealthWell Foundation® is a 501(c)(3) non-profit organization established in 2003 to address the needs of individuals who cannot afford their insurance copayments, premiums, coinsurance, or other out-of-pocket health care costs.
http://www.healthwellfoundation.org/about.aspx

The Chronic Disease Fund is an independent 501(c)(3) non-profit charitable organization that helps underinsured patients with chronic disease, cancers or life-altering conditions obtain the expensive medications they need
http://www.cdfund.org/
1-877-968-7233

The CancerCare Co-Payment Assistance Foundation is a not-for-profit organization established in 2007 to address the needs of individuals who cannot afford their insurance co-payments to cover the cost of medications for treating cancer.
http://www.cancercarecopay.org/
1-866-55-COPAY
NORD (National Organization for Rare Diseases) works closely with humanitarian-minded pharmaceutical and biotechnology companies to ensure that certain vital medications are available to those individuals whose income is too high to qualify for Medicaid but too low to pay for their prescribed medications.
http://www.rarediseases.org/programs/medication

The Patient Access Network Foundation is an independent, non-profit 501(c)(3) organization, unaffiliated with any of its donors, dedicated to assisting insured patients who cannot afford the out-of-pocket costs associated with their treatment needs.
http://www.patientaccessnetwork.org/About.html
1-866-316-PANF

The Patient Advocate Foundation Co-Pay Relief Program currently provides direct financial support to insured patients, including Medicare Part D beneficiaries, who must financially and medically qualify to access pharmaceutical co-payment assistance.
http://www.copays.org/
1-866-512-3861

Caregiver Resources and Support
National Family Caregivers Association has a resources for caregivers page:
http://www.nfcacares.org/caregiving_resources/agencies_and_organizations.cfm

The American Red Cross has a Family Caregiving Program and a Family Caregiving reference guide to assist caregivers: http://www.redcross.org/services/hss/care/family.html

Caregiver Emergency Respite Fund is a public charity providing emergency assistance and education programs for family caregivers. This site contains comprehensive advice for caregivers:
http://www.caregiveremergencyrespitefund.org
317-713-2979

Patient Air Transportation
Angel Flight® Mid-Atlantic is a non-profit organization serving patients in need and their families. They provide air transport to specialized medical facilities for evaluation, diagnosis, treatment and rehabilitation. Serves the District of Columbia, Maryland, Virginia, and West Virginia.
http://www.angelflightmidatlantic.org/

Children’s Flight of Hope’s mission is to provide free private air transportation to and from medical facilities for critically ill or injured children (with their families or guardians) who, due to medical, financial, or logistical reasons, are unable to travel to their destinations by any other mode. (To or from North Carolina.) http://www.childrensflightofhope.org/program.htm

Corporate Angel Network arranges free travel through empty seats on corporate jets for cancer patients. http://www.corpangelnetwork.org/about/index.html

Mercy Medical Airlift’s mission is to ensure that no needy patient is denied access to distant specialized medical evaluation, diagnosis or treatment for lack of a means of long-distance medical air transportation; further, to ensure the provision of urgent transportation in situations of compelling human need and homeland security emergencies. (Manassas, VA)
http://www.mercymedical.org/
**National Patient Air Transport Helpline** will provide needy kids referrals to a charitable air medical transportation to see out of area specialist. (Virginia Beach, VA)  
1-800-296-1217

**The National Patient Travel Center**’s mission is "...to ensure that no financially-needy patient is denied access to distant specialized medical evaluation, diagnosis or treatment for lack of a means of long-distance medical air transportation."
http://www.patienttravel.org/index.html
1-800-296-1217

LOCAL SUPPORT GROUPS FOR PEOPLE WITH LIVER DISEASE

Support groups can be an important resource for patients and their loved ones. Hepatitis C, in particular, can be a difficult treatment to get through. It can help to talk and gain insight from other people going through the same situation. We are fortunate to have a number of local support groups that can help you as you learn about your diagnosis, contemplate treatment and lifestyle changes and to support you as you go through treatment.

Maryland

Annapolis
Liver Health Support Group - Anne Arundel Medical Center Sajak Pavilion
2002 Medical Pkwy 2nd floor, Room 250-C Annapolis, MD 21401
Meets: 2nd Monday of every month 6:30-8:30 PM
This is a patient led support and advocacy group.
Contact Robin Lord Smith for more information: murmayds@msn.com

Frederick
Living with Hepatitis and Transplant Support Group
Frederick County Health Department /350 Montevue Lane/ Frederick, MD 21702
Meets: quarterly
Be a part of our group. We share experiences and support each other through our journey with liver disease and transplantation.
Contact Constance for more information. 301-631-3343

Maryland PBC Support Groups
Meets: varied schedule
Our group meets occasionally for lunch or dinner to share ideas and experiences with PBC. We welcome all interested in learning more about PBC or living and supporting those with PBC.
Contact Mitzi or Barbara for more information.
Phone: 301-320-0018 (301-871-6729)

Rockville
Hepatitis Support Group
Shady Grove Adventist Hospital/Weinshel Health Education Center (Elm, Maple, or Willow Room)
/9901 Medical Center Drive/Rockville, MD 20850
Meets: First Tuesday of Each Month at 7:00 PM
Many people who have hepatitis feel frustrated and alone. Talking to others with similar concerns is often helpful. Please join us for our Monthly Meetings that serve as an emotional and educational support network for people with hepatitis.
No need to RSVP- just drop in for more information.

Silver Spring
Hepatitis Support Group
Capital Gastroenterology Consultants /10801 Lockwood Drive Suite 200/Silver Spring, MD
Meets: Every 4th Saturday of the month from 11:00am to 1:00pm
All are welcome: those who suffer from hepatitis, their loved ones and friends, members of the medical profession, and public health workers. We do request that the confidentiality of meeting-goers be respected. There is no fee. Light refreshments are served.
This is a peer group, facilitated by patients and family members, although we sometimes have guest speakers. Bring your questions and concerns, and we'll help each other. If you have a spouse, loved one, or friend who would like to know more about hepatitis, bring them along.
Contact Becky Lorenz for more information/ 301-989-9097/ weldermom@yahoo.com

**Virginia**

**Charlottesville**
ALF / UVA Digestive Health Center of Excellence HCV Support Group
University of Virginia Medical Center/ East Hospital/ Digestive Diseases Conference Room
Charlottesville, VA
Meets: meeting times vary—please call for next scheduled meeting
Education and support for people living with, affected by or interested in learning more about hepatitis C. We have frequent guest speakers with expertise to share.
Contact Call Linda to RSVP or for more information. 434-243-2801

**Richmond**
ALF / Richmond Hepatitis C Support Group
Bon Secours at St. Mary's Hospital/ 5801 Bremo Rd./ Room 163/ Richmond, VA 23226
Meets: quarterly
Support and education groups for people living with or wanting more information about hepatitis C. All are welcome. Contact Call Carol to RSVP for more information. 804-282-8980

**Roanoke**
Hepatitis C Support Group
Lewis-Gale Foundation/ 3807 Brandon Avenue Suite 1000/ Roanoke, VA 24018
Meets: Fourth Tuesday of Each Month at 7:00 PM
Join us as we work to change the way people view liver patients. We have many people who are willing to share ideas and experiences. Guest speakers enlighten the group on many aspects related to Hepatitis C.
Contact Judith F. Hagadorn for more information. 540-774-4022

**Virginia PBC Support Groups**
Our group meets to discuss nutrition, exercise and a vast array of topics related to PBC. We are open to patients, spouses, or family members of those affected by PBC.
Contact Anne Beard for more information.
Phone: 434-724-4297

Hepatitis B and C testing available to current patients with a doctor’s order. Fees based on a sliding scale. Call for more information.
**MARYLAND**

**MD Health Information**

Ask your doctor or primary medical care provider if you have questions about hepatitis testing or treatment.

If you don’t have health insurance or a health care provider, you can go to http://dhmh.state.md.us/mma/mmahome.html to access information about the Maryland Medical Assistance Program. Individuals may be eligible for services depending upon income and other factors. You can also contact your local (county or Baltimore City) Department of Social Services to ask about how you might get help.

If you are a United States Military Veteran, contact the Baltimore VA Medical System at www.hepatitis.va.gov or call 1-800-463-6295.

**General Resources**

The Frederick County Hepatitis Clinic, Inc.

In this area, we are fortunate to have one dedicated hepatitis clinic. The clinic offers hepatitis testing and treatment for qualifying individuals. Patients are asked to make a $20.00 co-pay per visit. You do not need to be a resident of Maryland.

350 Montevue Lane
Frederick, MD 21702
301-631-3343

Maryland Medbank
410-821-9262
The Maryland Medbank Program serves eligible low-income, chronically ill, underinsured and uninsured individuals in Maryland who meet certain financial criteria.

VA Health Districts/Departments
Virginia is divided up into 35 health districts, some of which serve as an umbrella organization for several local county health departments. If information is provided under the name of the health district, services and prices are the same for all the county health departments in the district. Otherwise, information specific to the county health departments is listed under each county. For more information and a map of all of Virginia’s health districts, visit the Virginia Department of Health’s website at http://www.vdh.state.va.us/.

Alexandria Health Department
Headquarters Office
4480 King Street,
Alexandria, VA, 22302
Phone: 703-838-4400
Fax: 703-838-4038
http://www.alexhealth.org/
Immunization Clinic ext. 208, 318
